INTRODUCTION

This is the first annual statistical report issued by the Montana State Board of Health. Prior to this time, statistical information has been published as a part of the Biennial Report.

There are several reasons for publishing statistical data on an annual rather than a biennial basis. Probably the most important is that information can be made available to the public more quickly than if it is published biennially. For example, tabulations of 1952 vital statistics were not available in published form until the 27th Biennial Report, February, 1955. It is hoped that by publishing vital statistics annually that a report may be available within eight months following the close of the calendar year.

Also, it will be possible to publish more detailed tabulations than were possible when statistics were included as a part of the Biennial Report of the Board.

The purpose of this report is to compile, in accessible form, data regarding vital events and morbidity. Information published herein is limited to that felt to be of general interest. In most cases, more detailed information is available upon request.

Sources of data shown in the tabulations of this report are primarily records collected by the Montana Board of Health. These records include certificates of birth, death, fetal death (stillbirth), and records of marriage, divorce, and morbidity.

LIMITATIONS OF THESE DATA

Completeness of Registration and Reporting

Few restrictions need be imposed upon the interpretation of tabulations of birth and death data in this report because of incompleteness. Completeness of birth registration in Montana was tested in 1950 as a part of a nation-wide study made by the Bureau of the Census. This showed Montana's registration of births to be 99.5% complete. Registration of deaths is even more complete. A death certificate must be filed in Montana before a permit for burial or removal can be issued.

No measure of the completeness of reporting of fetal deaths (stillbirths) is available. A more important limitation to consider in interpreting data on this subject is: the variation among the several states as to the definition of what constitutes a fetal death.

Original records of marriage and divorces are not filed in this office. It does file original birth and death certificates. Transcripts, containing certain of the information on the original marriage and divorce records, are made by local Clerks of Court, to be filed in this office. No formal tests of completeness have been made on this reporting. Experience suggests that marriages and divorces are reported as completely as births and deaths.

Delay in Filing

Very few records are filed for events that occurred in the year covered by this report that are not included in these tabulations. All records for 1954 which were received during that year or during the first four months of 1955 are included in this report. Records received after this deadline are not included in these tabulations. These constitute a small fraction of one percent of all types of records.

Geographic Allocation

Births and deaths may be tabulated by place of occurrence or by place of residence of the person involved. For deaths, the place of residence is the usual residence of the decedent. For births, the usual residence of the child is the same as that of the mother.

Interstate exchange of transcripts of certificates for persons whose residence was in a state other than the one in which the event occurred, permits tabulation by place of residence. Titles of tables in this report indicate whether the tabulation is by residence or occurrence.

Deaths in hospitals, sanatoria, and other institutions are allocated to the place of previous residence, regardless of the length of stay in the institution.

Medical Certification

Causes of death reported on death certificates are classified according to the Sixth Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death. This system, established by international agreement, attempts to allocate death to what the attending physician considers the underlying cause. Deaths are classified under this philosophy whenever possible. Exceptions must be made, when the underlying cause is not apparent from the certification and when clarification cannot be secured. In these instances, a system of rules is applied to select the probable underlying cause.

Prior to the adoption, in 1949, of the Sixth Revision of the International List, cause-of-death coders used a mechanical procedure for choosing the cause of death where two or more causes were given. Caution must be taken in comparing cause-specific death rates prior to 1949.

Age and Race

Classification of vital events by age and race introduces difficulties because of incorrect entries.

A frequent error in the reporting of age is evident in the frequent reporting of ages ending in 0 and 5. Theory suggests this to be due to a tendency for persons to round their ages. In addition, it is felt that persons under 21 and those in the older age groups have a tendency to overstate age. Those of middle age tend to understate their age. An attempt has been made in this report to offset some of these difficulties by grouping ages. In this way, the overstatement of ages ending in 0 and 5 is grouped in with the understatement of ages ending in other digits.

The tabulation of vital events by race has limitations where persons of mixed blood are involved. In general, the statement of race on the certificate reflects the opinion of the informant. It does not necessarily follow any prescribed rules for the reporting of race. Information on race presented in this report is shown simply as "White" and "Other". This makes it possible to classify all but a few deaths and there is little confusion with concepts of nationality, country of origin of parents or other characteristics. In the racial classification used in this report, white includes "Mexican".

Population Estimates

The population estimates shown in Table 18 have as their base the federal census taken as of April 1, 1950.

In making estimates for subsequent years, the ratio of the total population to the school census (age 0-21, for the year 1950 is assumed to be the same as the ratio between the school census and the total population for the estimate year. A correction is made in the school census figures to take account of the increasing proportion of children 0-21 years of age in the general population.
